

# Convolutional Neural Network

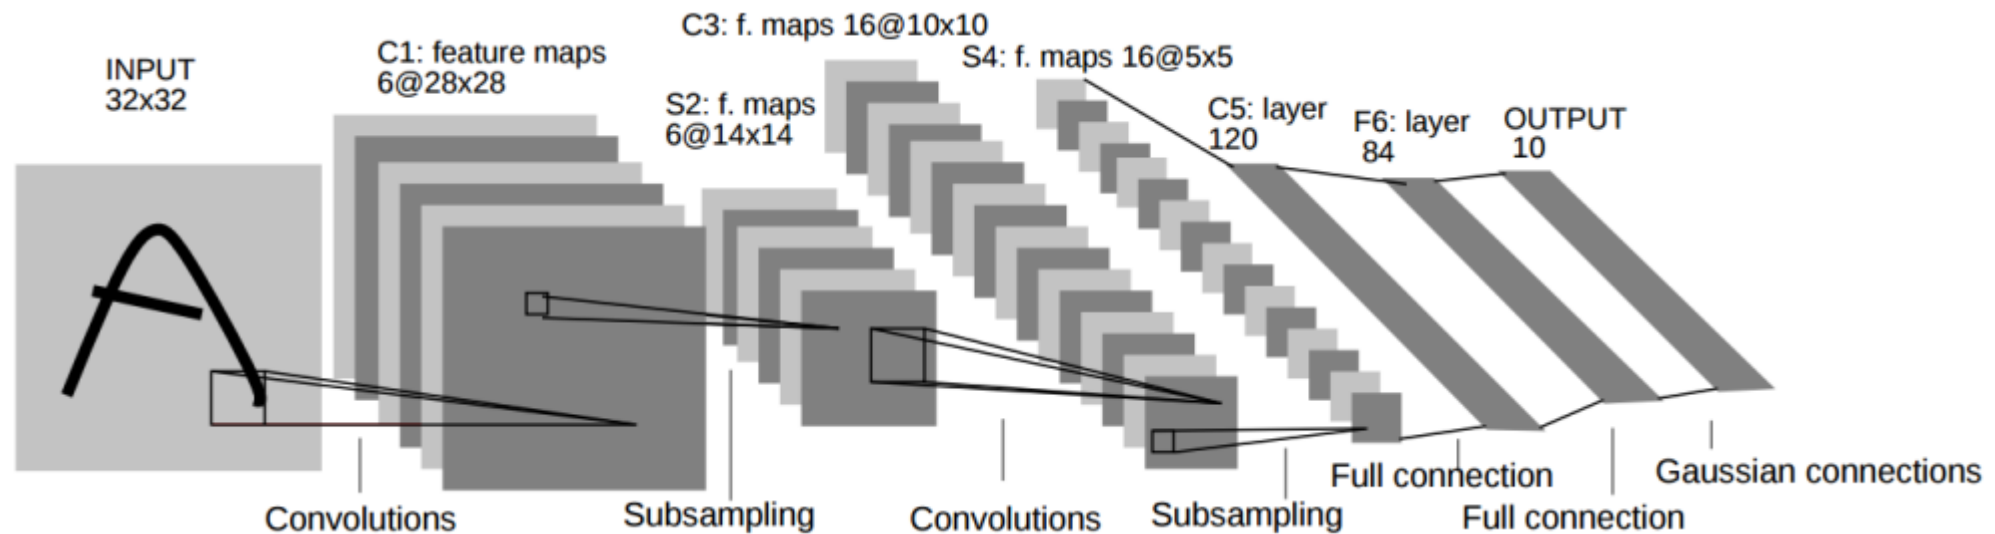

## Case Study

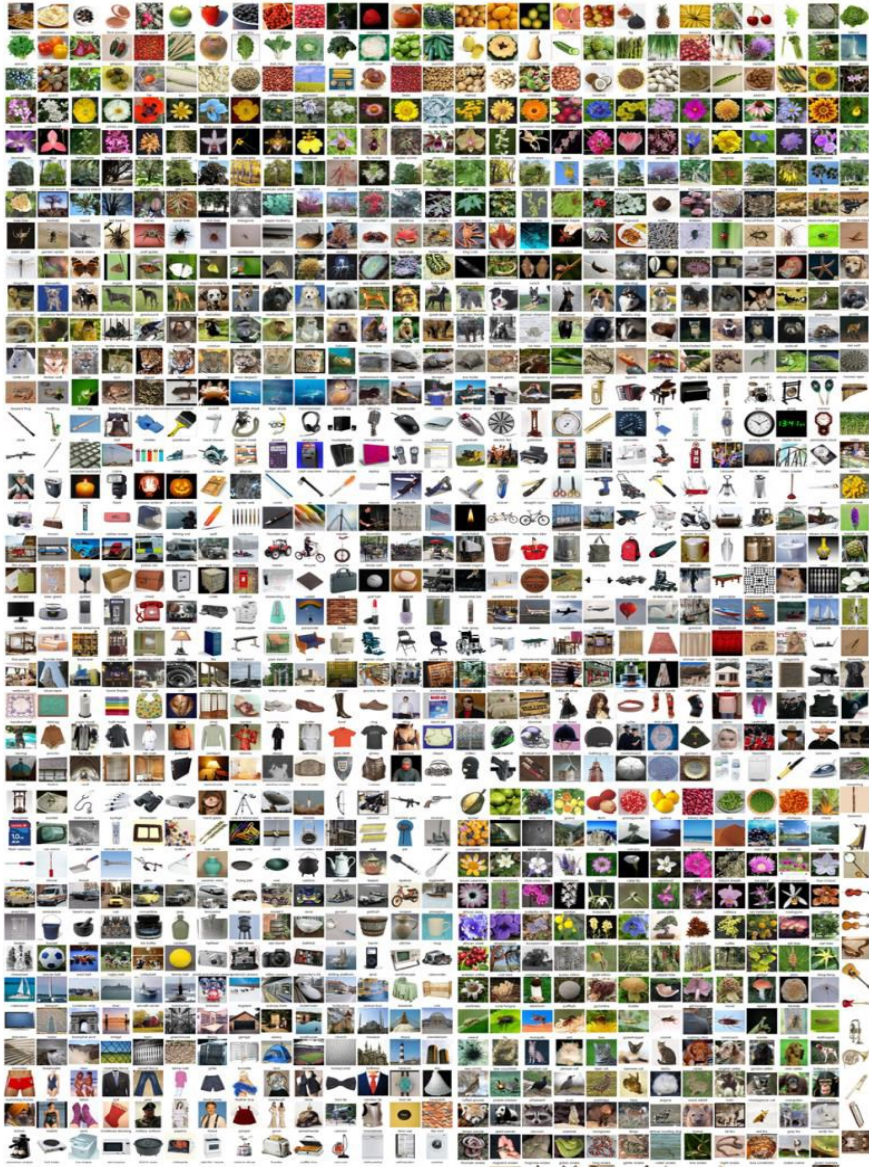

Fast Campus  
Start Deep Learning with TensorFlow

# LeNet-5 (LeCun et al., 1998)

- A father of CNN
- Convolution filters were  $5 \times 5$ , applied at stride 1
- Subsampling (Pooling) layers were  $2 \times 2$  applied at stride 2
- [Conv – Pool – Conv – Pool – FC – FC – FC]

# Large Scale Image Classification

- ImageNet
  - Over 15 million labeled high-resolution images
  - Roughly 22,000 categories
  - Collected from the web
  - Labeled by human labelers using Amazon's Mechanical Turk crowd-sourcing tool
- ImageNet Large-Scale Visual Recognition Challenge (ILSVRC)
  - Uses a subset of ImageNet
    - 1,000 categories
    - 1.2 million training images
    - 50,000 validation images
    - 150,000 test images
  - Report two error rates:
    - Top-1 and top-5

# ImageNet Classification Results

Human error (5.1%)  
surpassed in 2015

- **AlexNet (2012): First CNN (15.4%)**
  - 8 layers
  - 61 million parameters
- **ZFNet (2013): 15.4% to 11.2%**
  - 8 layers
  - More filters. Denser stride.
- **VGGNet (2014): 11.2% to 7.3%**
  - Beautifully uniform: 3x3 conv, stride 1, pad 1, 2x2 max pool
  - 16 layers
  - 138 million parameters
- **GoLeNet (2014): 11.2% to 6.7%**
  - Inception modules
  - 22 layers
  - 5 million parameters (throw away fully connected layers)
- **ResNet (2015): 6.7% to 3.57%**
  - More layers = better performance
  - 152 layers
- **CUIImage (2016): 3.57% to 2.99%**
  - Ensemble of 6 models
- **SENet (2017): 2.99% to 2.251%**
  - Squeeze and excitation block: network is allowed to adaptively adjust the weighting of each feature map in the convolutional block.

# AlexNet (Krizhevsky, 2012)

- First use of ReLU
- Used norm layers(not common anymore)
- Data Augmentation
- Dropout 0.5
- Batch size 128
- SGD Momentum 0.9
- Learning rate 0.01, reduced by 10
- L2 weight decay  $5e-4$
- 7 CNN ensemble: 18.2%  $\rightarrow$  15.4%

# AlexNet (Krizhevsky, 2012)

- Input: 227 x 227 x 3 images
- First layer(CONV1): 96 11x11 filters applied at stride 4  
→ Output size : 55 x 55 x 96  
→ # of parameters :  $(11 \times 11 \times 3) \times 96 = 35K$

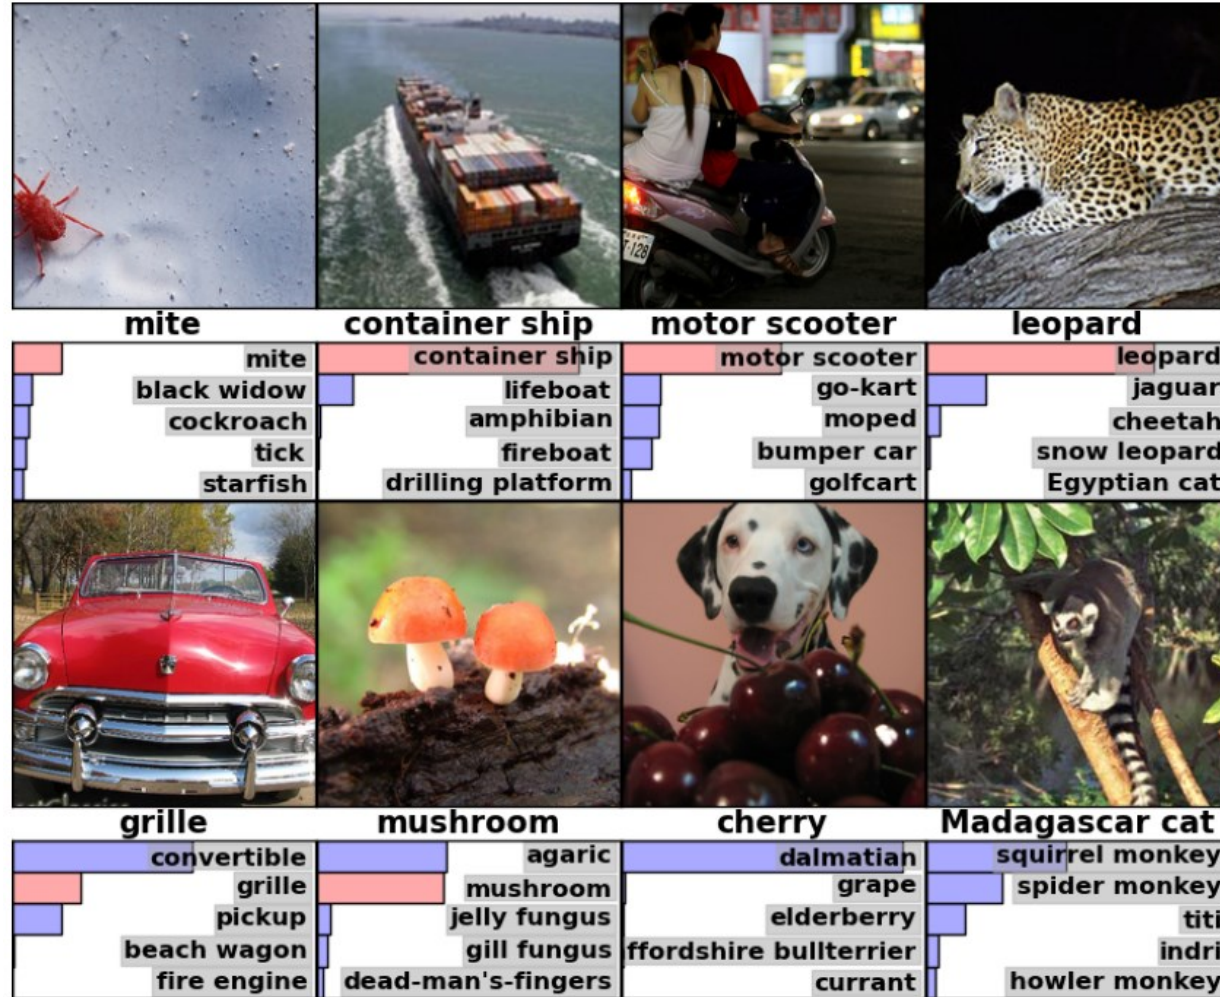

# AlexNet (Krizhevsky, 2012)

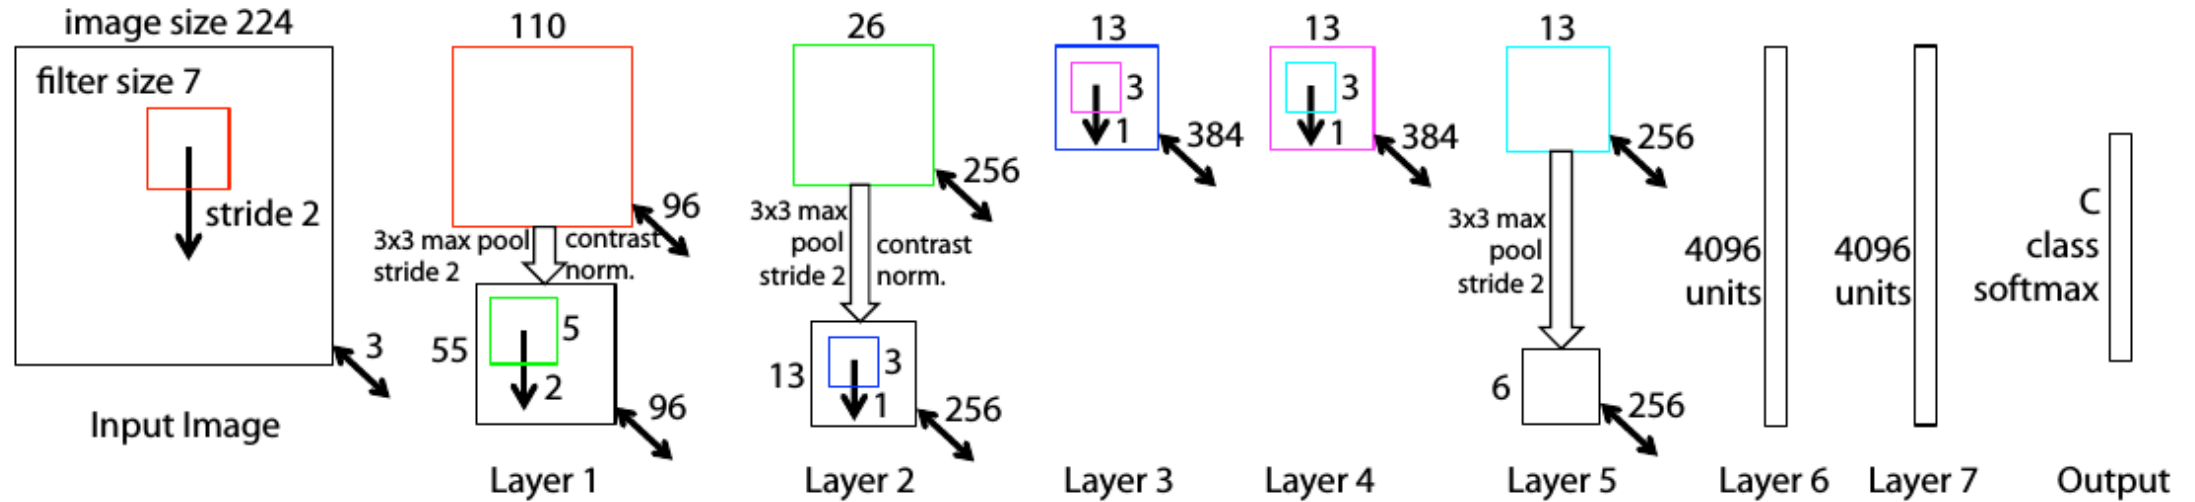

- [Conv1 – Pool1 – Norm1 – Conv2 – Pool2 – Norm2 – Conv3 – Conv4 – Conv5 – Pool 5 – FC6 – FC7 – FC8]
- 7 hidden layers, 650,000 neurons, 60M parameters
- Training for 1 week, using 2-GPUs
  - Trained on GTX 580 GPU with only 3GB of memory. Network spread across 2 GPUs, half the neurons(feature maps) on each GPU

# AlexNet Result

# ZFNet (Zeiler and Fergus, 2013)

- Similar to AlexNet except:
  - Conv1 – change from (11x11 stride 4) to (7x7 stride 2)
  - Conv3, 4, 5: instead of 384, 384, 256 filters use 512, 1024, 512
  - Top 5 error : 16.4% → 11.7%

# VGGNet (Simonyan and Zisserman, 2014)

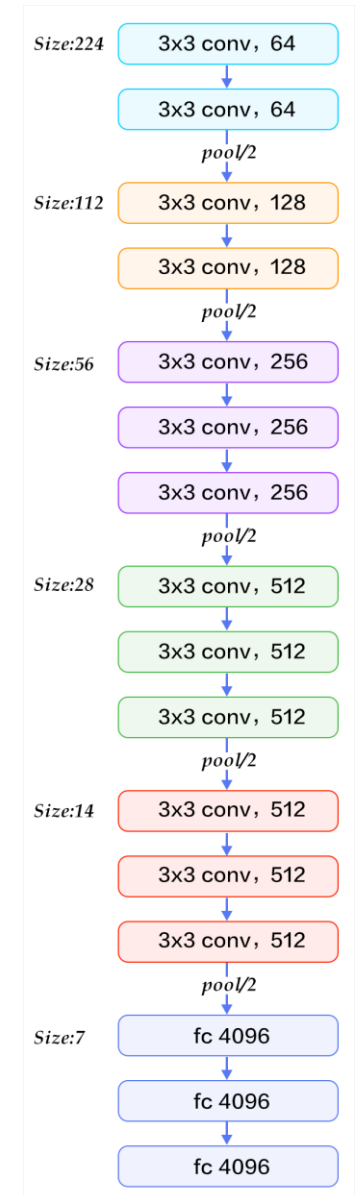

- ILSVRC'14 2<sup>nd</sup> in classification, 1<sup>st</sup> in localization
- Small filters, Deeper networks
  - 8 layers(AlexNet) → 16~19 layers(VGG16, VGG19)
  - Only use 3x3 conv stride 1, pad 1 & 2x2 maxpool stride 2
  - 11.7% top 5 error(ZFNet) → 7.3% top 5 error
- Why use only 3x3 filters?
  - Stack of 3x3 conv layers has same effective receptive field as 5x5 or 7x7 conv layer
  - Deeper means more non-linearities
  - Fewer parameters:  
 $2 \times (3 \times 3 \times C)$  vs  $(5 \times 5 \times C)$   
→ regularization effect

two successive  
3x3 convolutions

5x5 convolution

FC: [1x1x4096]    memory: 4096    params:  $4096*4096 = 16,777,216$

FC: [1x1x1000]    memory: 1000    params:  $4096*1000 = 4,096,000$

TOTAL memory:  $24\text{M} * 4 \text{ bytes} \sim 96\text{MB}$  / image (for a forward pass)

TOTAL params: 138M parameters

# GoogLeNet (Szegedy, 2014)

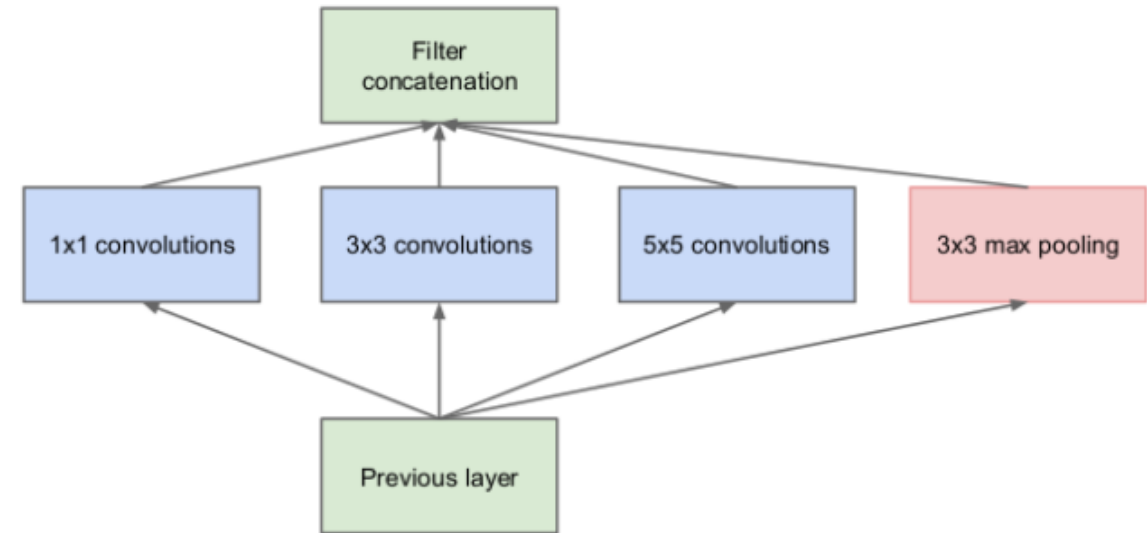

- Deeper networks, with computational efficiency
  - 22 layers
  - Efficient “Inception” module
  - Global average pooling
  - Only 5 million parameters
  - ILSVRC’14 classification winner
    - 6.7% top 5 error

# Inception Module

- Naïve Inception module
    - Apply parallel filter operations on the input from previous layer
      - Multiple receptive field sizes for convolution
      - Pooling operation(3x3)
    - Concatenate all filter outputs together channel-wise
    - What is the problem with this?
      - Very expensive compute
      - Depth after concatenation can grow and grow at every layer!
- Use Bottleneck layers

# 1x1 convolutions

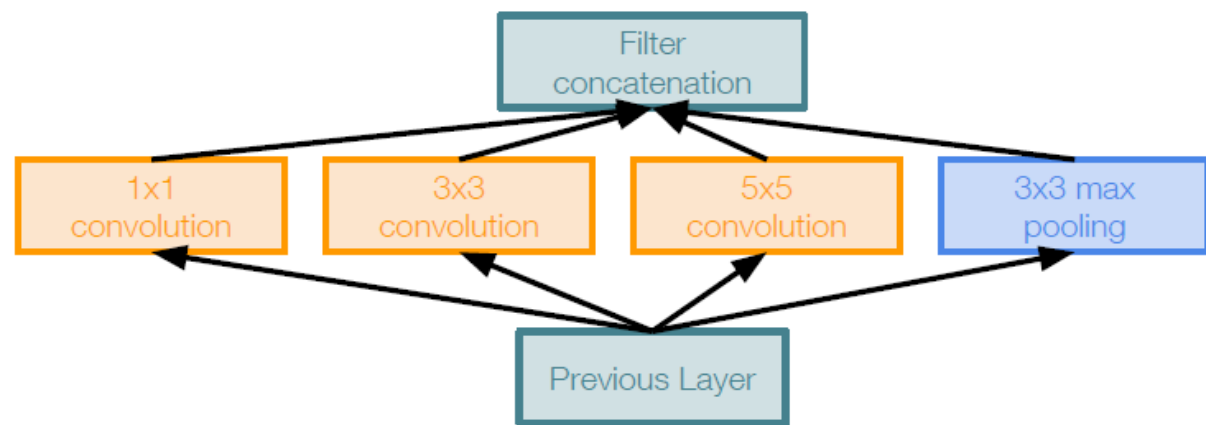

1x1 CONV  
with 32 filters

(each filter has size  
1x1x64, and performs a  
64-dimensional dot  
product)

# Inception Module

Table 1: GoogLeNet incarnation of the Inception architecture

# Inception-v3

- Factorization of filters

# ResNet (He, 2015)

- Revolution of Depth

AlexNet, 8 layers  
(ILSVRC 2012)

VGG, 19 layers  
(ILSVRC 2014)

ResNet, 152 layers  
(ILSVRC 2015)

# ResNet

- Swept 1<sup>st</sup> place in all ILSVRC and COCO 2015 competitions

## MSRA @ ILSVRC & COCO 2015 Competitions

- **1st places in all five main tracks**

- ImageNet Classification: “Ultra-deep” (quote Yann) **152-layer** nets
- ImageNet Detection: **16%** better than 2nd
- ImageNet Localization: **27%** better than 2nd
- COCO Detection: **11%** better than 2nd
- COCO Segmentation: **12%** better than 2nd

- ILSVRC’15 classification winner(3.6% top 5 error) – better than “human performance” (Russakovsky 2014)

# ResNet

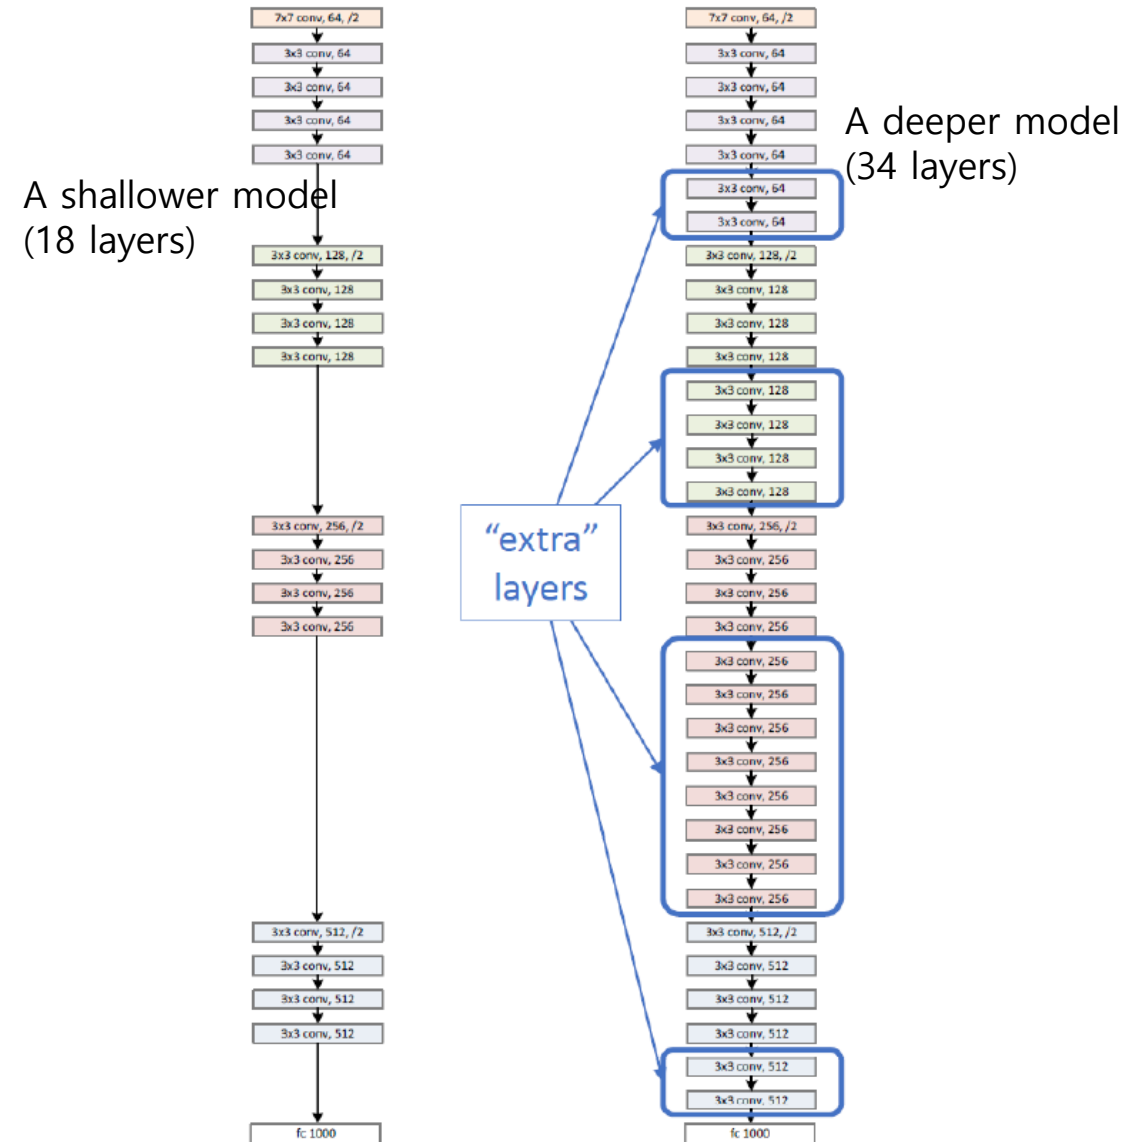

- What happens when we continue stacking deeper layers on a “plain” convolutional neural network?

- 56-layer model performs worse on both training and test error
  - The deeper model performs worse, but it's not caused by overfitting!

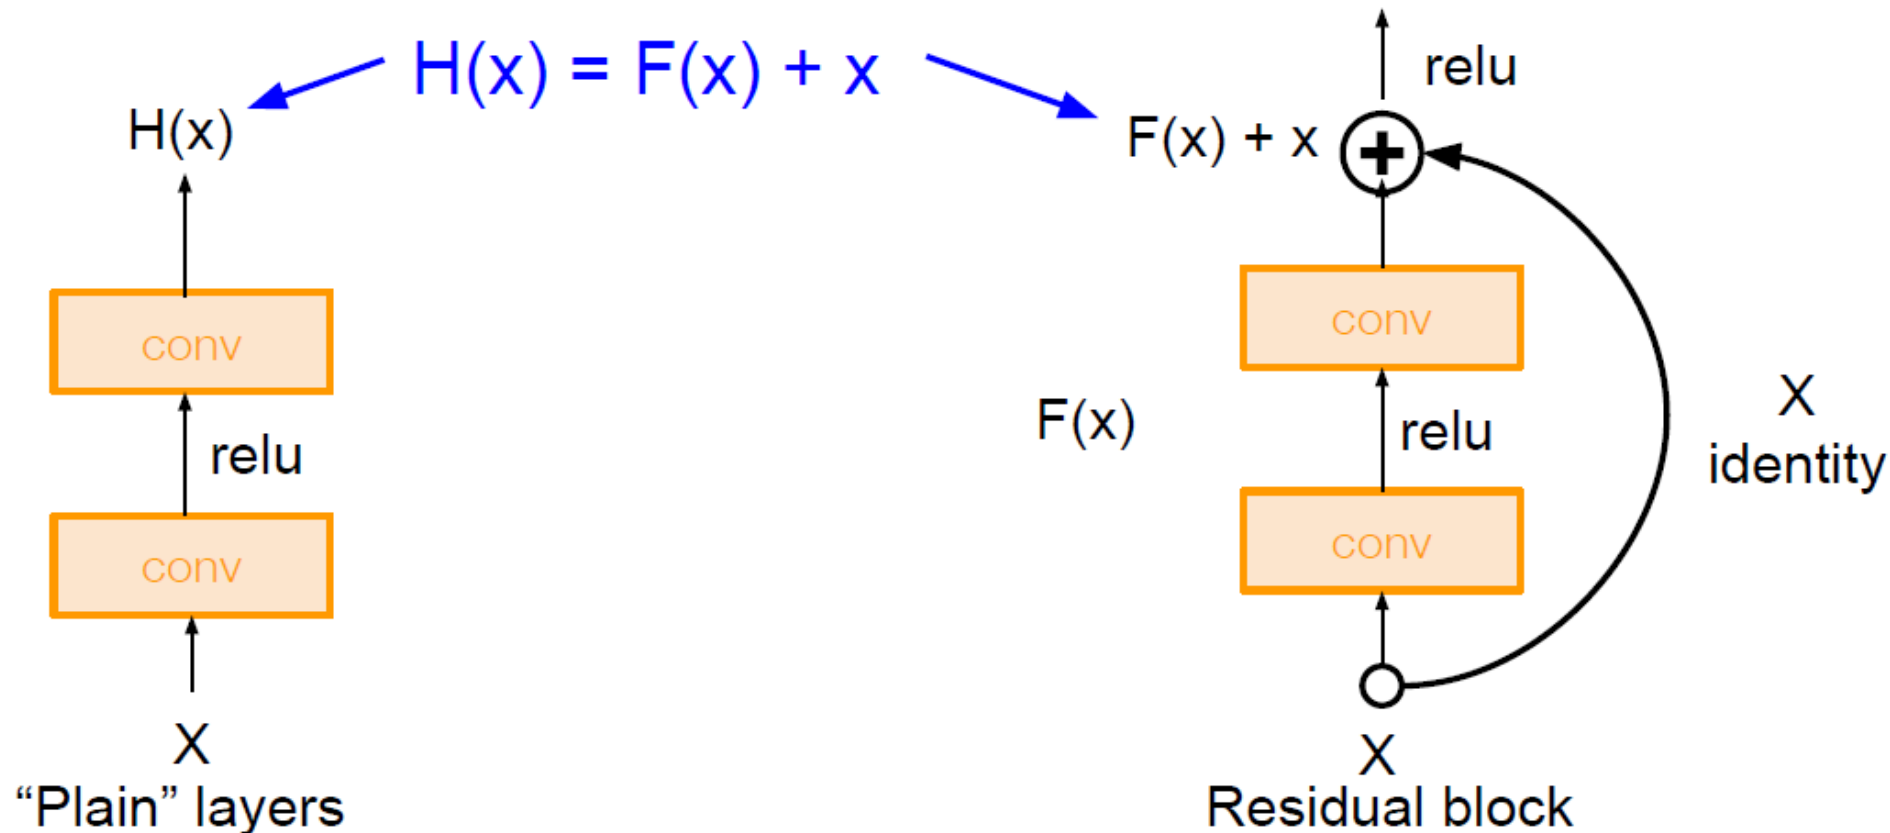

# ResNet

- Hypothesis: the problem is an *optimization* problem, deeper models are harder to optimize
  - The deeper model should be able to perform at least as well as the shallower model
  - A solution by construction is copying the learned layers from the shallower model and setting additional layers to identity mapping

# ResNet

- Solution: Use network layers to fit a residual mapping instead of directly trying to fit a desired underlying mapping

Use layers to  
fit residual  
 $F(x) = H(x) - x$   
instead of  
 $H(x)$  directly

# ResNet – Experimental Results

## CIFAR-10 experiments

- Deep ResNets can be trained without difficulties
- Deeper ResNets have **lower training error**, and also lower test error

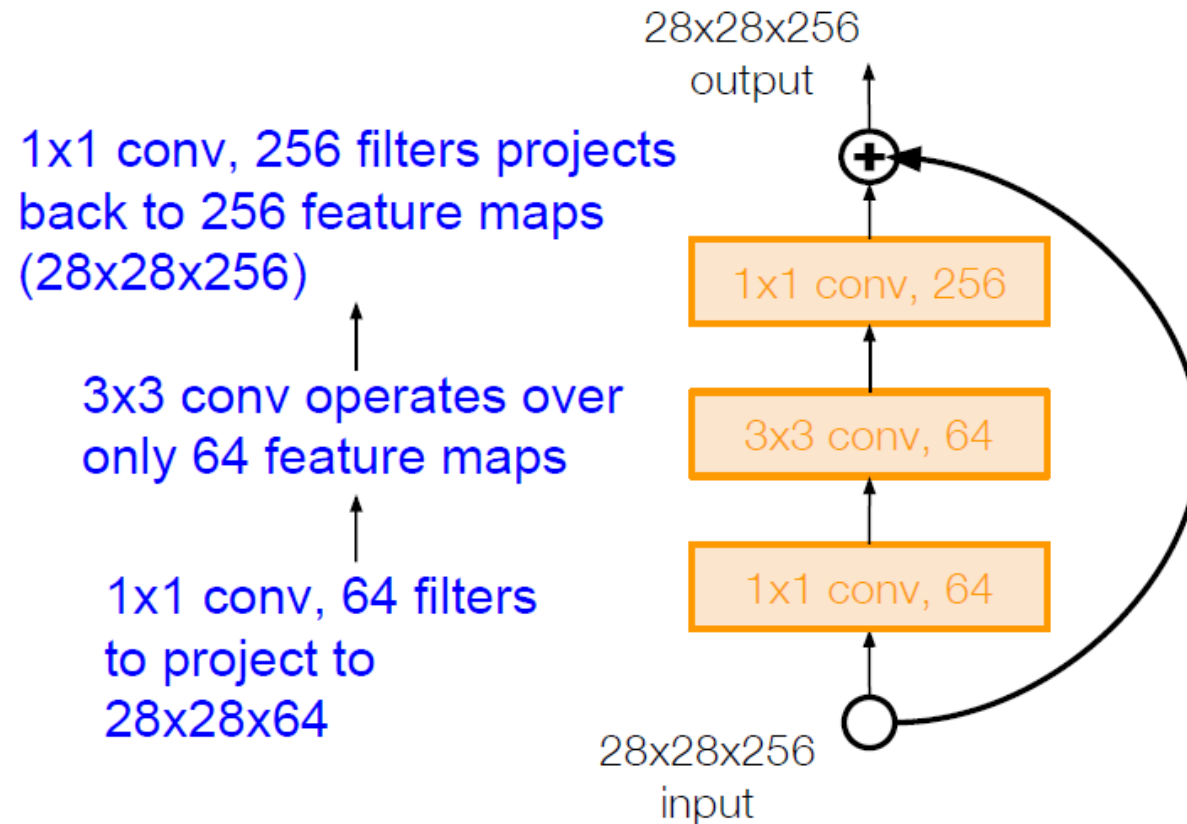

# ResNet

- Full ResNet architecture
  - Stack residual blocks
  - Every residual block has two 3x3 conv layers
  - Periodically double # of filters and downsample spatially using stride 2
  - Additional conv layer at the beginning
  - No FC layers at the end(only FC 100 to output classes)

# Bottleneck Architecture

- For deeper networks(ResNet-50+), use “bottleneck” layer to improve efficiency(similar to GoogLeNet)

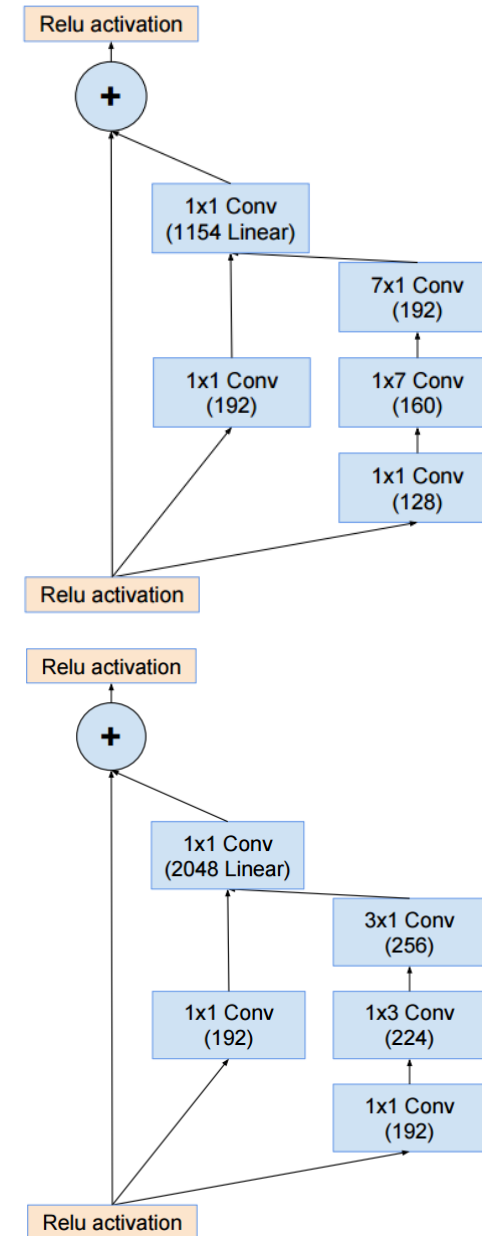

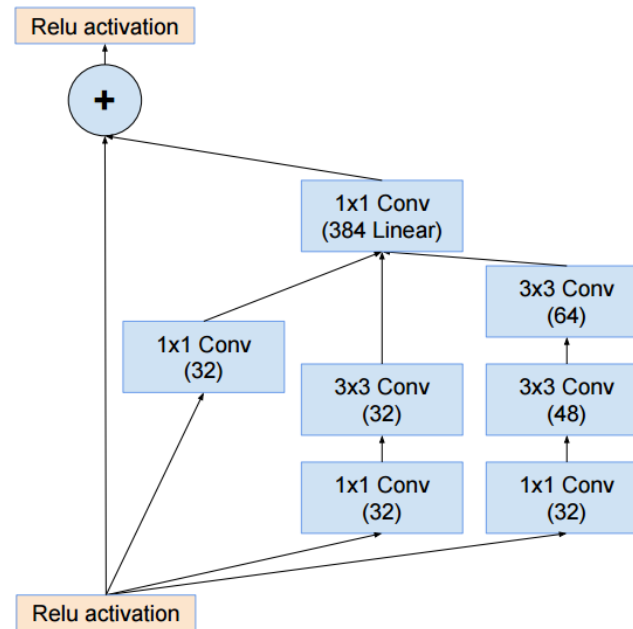

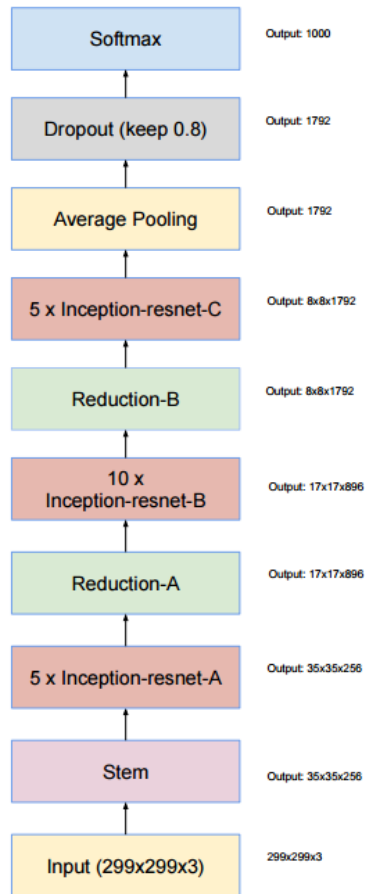

# ResNet

- Batch Normalization after every Conv layer
- Xavier/2 initialization from He et al.
- SGD + Momentum(0.9)
- Learning rate: 0.1, divided by 10 when validation error plateaus
- Mini-batch size 256
- Weight decay of  $1e-5$
- No dropout used

# Inception-ResNet

- Inception + ResNet

"Inception-v4, Inception-ResNet and the Impact of Residual Connections on Learning"
